Carbon Monoxide Alarms

Carbon Monoxide is a silent killer, and with no smell or evidence it can send you into a deep sleep from which you will never awake. Carbon Monoxide, (CO), can be a result of a faulty appliance, blocked flue, etc.

The revised Document J of the Building Regulation, (effective October 2010), suggests that a CO alarm should be installed for every fixed wood and solid fuel appliance. (See this document at www.specflue.com - page 41).

High risk groups include children, unborn babies, pregnant mothers and the elderly.

CO-9D Alarm

The digital display CO-9D alarm can be used as a portable alarm, so installers can test for CO prior to working in a property.

CO-9X Alarm

The FireAngel brand is a respected brand within the industry.

Alarms emit at 85dB at 1m away.

Both alarms emit a 'low battery' bleep.

Both alarms have a test facility button.

Both have a 7 year sealed battery. CO-9D is a digital display unit, indicating the CO level, bar graph indicating risk and room temperature.
