

SIMPLE, CLEAN AND EASY TO USE FIRELIGHTERS.

BURNER Firelighters have all the advantages of solid firelighters, but none of the drawbacks such as:

- Kerosene smell at home or in the shop
- Kerosene smell on hands and clothes
- Evaporation of the inflammable constituent after opening the sales pack, resulting in poor fire lightning performance
- Other solid firelighters are hardened with Sulphuric acid, which is given off into the atmosphere, when the firelighter is burning
- Impossible to bring with you as an individual block, for use in outdoor activities
- Low flash point, which gives restrictions in transportation and storage.
- Contains aromatic solvents, which can cause brain damage

All such drawbacks are eliminated with **BURNER firelighters**. With BURNER you find the additional advantages:

- Low flame height that releases the heat close to the charcoal/fuel and not into the air
- The large surface area of the sachet gives a very hot combustion and the firelighter does not become clogged with ashes
- Ability to light the BURNER even if it has been wet
- They are odourless, have a high flash point (>65°C), are free from aromatic solvents and require no danger code
- They are classified as non-toxic by the Swiss Government Approval No. (bag) 88670.
- They are certified after the new EU DIN-norm EN 1860-3 by T.Ü.V. in Germany, who control: chemical composition, safe handling, retail packaging, labelling, instructions of use and the environmental aspects
- Burning time: 8-10 minutes

Supplied in a tube of 100 Firelighters
